Course Objectives											
"(1) To ui (2) To ma shear reir	nderstand ake a secti nforcemen	the mecha on designs t)."	nical characteristi of beams and col	cs of rectangular s lumns based on ma	ection. aterials' allowat	le stress	s (to calc	culate the main reinforcement and			
Rubric											
			Ideal Level	Ideal Level		Standard Level		Unacceptable Level			
Achievement 1			Fully understa properties of b columns.	Fully understand the mechanical properties of beams and columns.		Understand the mechanical properties of beams and columns.		Doesn't understand the mechanical properties of beams or columns.			
Achievement 2			Can fully unde the design of a beams and pill	Can fully understand and make the design of a cross section for beams and pillars.		and and make the ross section for pillars.		Can not understand or make the design of a cross section for beams and pillars.

Teachin	a Metho	d									
Outline In this course of the section design me			ourse, students w hethods based on al part of building design methods. S the resilience ag	urse, students will learn the material characteristics of concrete and reinforced steel, and learn the thods based on allowable stress. Focuses will be placed on beams under flexure which are the main part of buildings, the mechanical characteristics of beams under flexure and axial tension, and sign methods. Students will also learn about the design methods for shear reinforcement for he resilience against shear stress of beams and columns.							
Style		The cou	rse is lecture style	э.							
Notice Students are expected to understand the material characteristics of concrete and reinforced steel and to a these knowledge into the section design of different parts. The students should always bring their calculat and use it during the class. The students should preview and review the content studied using e-learning working on peer instructions. The content of this course has a total of 90 hours, and includes self-learning the study time given during classes, previews, reviews, and assigned proverts. The students are expected to understand the section design of the study time given during classes.								e and reinforced steel and to apply ould always bring their calculators ntent studied using e-learning and ours, and includes self-learning to ts. 5 absences will be excused.

Course	Plan										
			Theme			Goals					
2nd Semeste r	3rd Quarter	1st	Introduction Lecture on the h Advantages and concrete structur	roduction ture on the history of Reinforced concrete. antages and disadvantages of reinforced crete structures and composite structures.			To understand the history of reinforced concrete, its strengths, and weaknesses.				
		2nd	Material and the Lecture on the chreater.	iterial and the allowable stress -1 cture on the characteristics of the concrete and par.			To understand the material properties and the allowable stress level of concrete and rebar.				
		3rd	Material and the Lecture on the al rebar.	aterial and the allowable stress -2 ecture on the allowable stress of concrete and bar.			To understand the material properties and the allowable stress level of concrete and rebar.				
		4th	Beam subjected Lecture on the m reinforced beam.	eam subjected to bending -1 ecture on the mechanical properties of the einforced beam.			To understand the neutral axis position of the single beam, the stress on each part of the beam, and the balanced cross section.				
		5th	Beam subjected Lecture on maxir allowable bendin cross-section.	eam subjected to bending -2 ecture on maximum bending moment and lowable bending moment of a reinforced beam oss-section.			To understand the design of the cross section of a single beam.				
		6th	Beam subjected Lecture on the m muscle beams.	eam subjected to bending -3 ecture on the mechanical properties of the multi- iuscle beams.			To understand the neutral axis position of the double-stranded beam, the stress on each part of the beam, and the balanced cross section.				
		7th	eam subjected to bending -4 ecture on allowable stress design of the double ebar beam section.			To understand the neutral axis position of the double-stranded beam, the stress on each part of the beam, and the balanced cross section.					
		8th	Mid-term Exam								
	4th Quarter	9th	Subjected to ber Lecture on the m column cross-sec	Subjected to bending and axial force-1 ecture on the mechanical properties of the plumn cross-section.			To understand the neutral axial position of column cross section, the stress on each part, and the balanced cross section				
		10th	Subjected to ben Lecture on the m column cross-sec	ubjected to bending and axial force -2 ecture on the mechanical properties of the plumn cross-section.			To understand the neutral axial position of column cross section, the stress on each part, and the balanced cross section				
		11th	Subjected to ben Lecture on the al and the allowable	I to bending and axial force -3 n the allowed axial force of the pillars Ilowable bending moment.			erstand t le bendi umn.	the allowable axial force and the ng moment of the cross section of			

		12th	Subjected to bending and axial for Lecture on the allowable stress de column cross-section.	ce -4 sign of the	To understand the calculation chart of the cross section of the column. Also, to calculate, using the sectional map, the section of the main reinforcement.					
		13th	Shear reinforcing -1 Lecture on the beam section shear distribution and the allowable shea	stress r power.	To understand the purpose and significance of the shear reinforcement, and the shearing force exerted in the concrete and the reinforcement steel.					
		14th	Shear reinforcing -2 Lecture on the shear reinforcemen beam.	t design of the	Understand shear forces and allowable shear forces of beams and can calculate the stirrup.					
		15th	Shear reinforcing -3 Lecture on the shear reinforcemen pillar.	t design of the	To understand shear force and permissible shear force in the design of a pillar, and calculate hoops.					
		16th	End-term Exam
